

## **IN THE SUBSTITUTE SPECIFICATION**

In the Substitute Specification, the paragraph at page 13 beginning at line 8 is amended as follows:

These data are subsequently associated with each of the separator sheets in step S38. If the data have been associated with the separator sheets in step S38 or if it was established in step S34 that the separator sheets should not be superimposed with further print images, in the step S40 a target file is established in which the print images of the separator sheets are stored with the aid of a PDF file. Formatting data of the separator sheet set (first data) are subsequently determined and stored in an initialization file (ini file) in the step S42. The initialization file in particular contains format information about the separator sheet set and format information for positioning and formatting of the text on the register tabs of the separator sheet set. The text data (third data for a first print job, or fourth data for a second print job) of the register tab texts and print image data for further print images that should be generated on the separator sheets outside of the tab (fifth data) are preferably stored in separate files that are then loaded for generation of the target file by a generator program module and are processed together with the information stored in the initialization file. The target file is then generated with the aid of the processed data.
